

Internet Explorer 9 (IE9) is not supported by Philips iSite pacs but with adjustment of a multitude of internet explorer settings you may be able to make it work!

First of all you must be launching IE in 32bit mode and not 64bit. In your program list it may show both, just choose the one that is not 64bit:

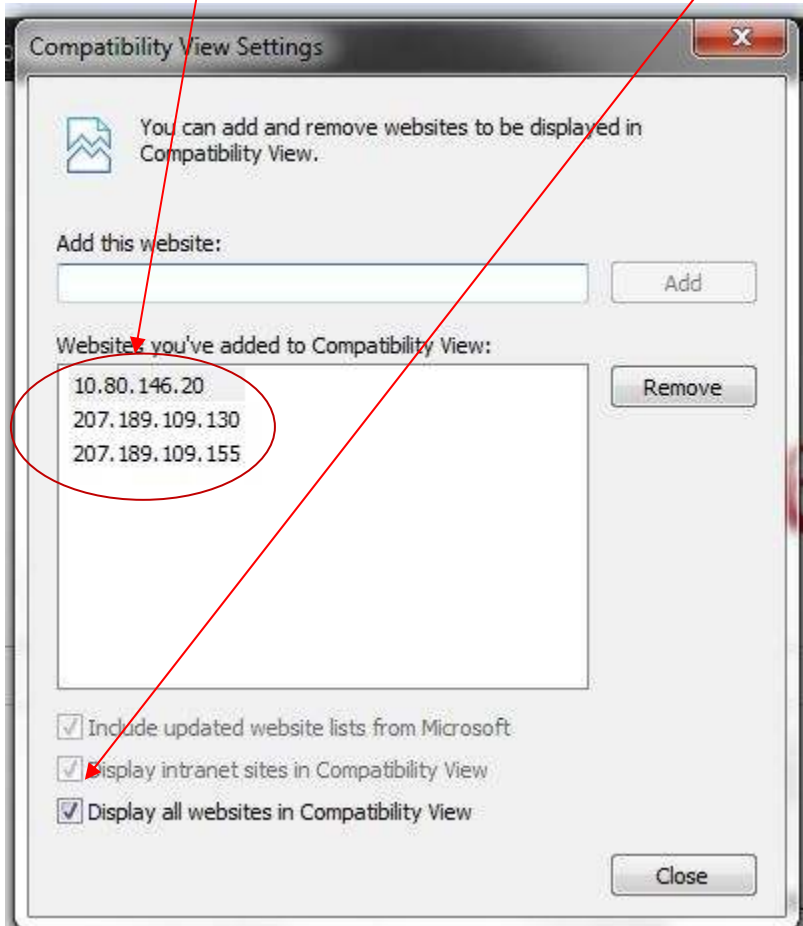

Now for the settings you need to change:

Open the tools menu from the IE9 toolbar

Turn **off** Pop-up Blocker and open Compatibility View Settings

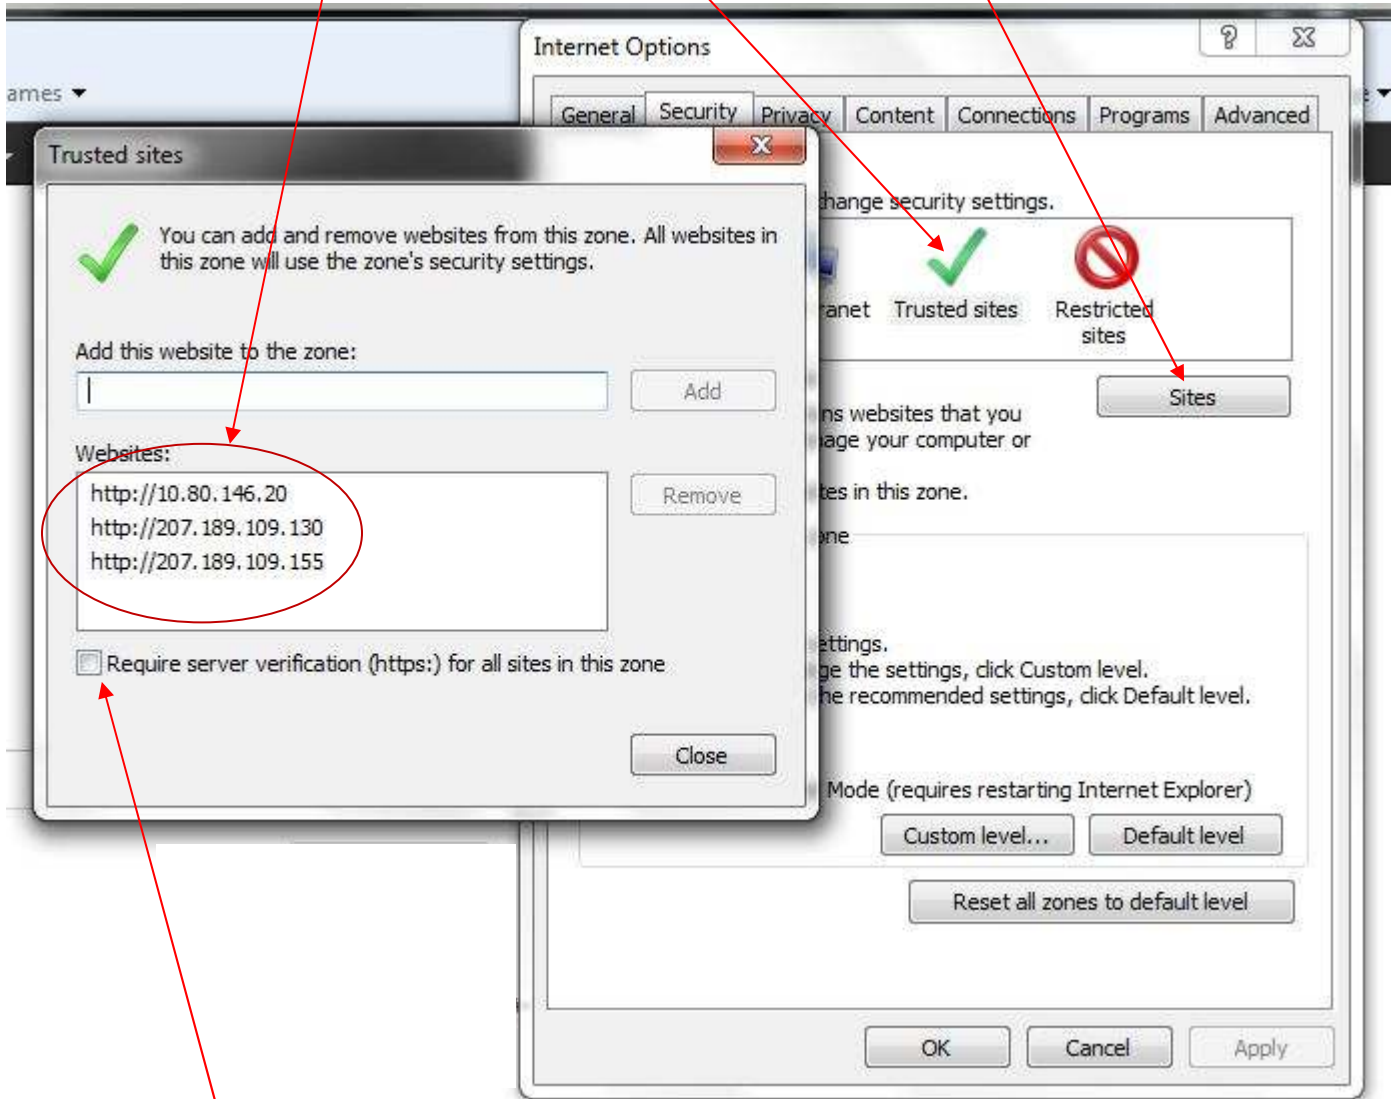

Add these web addresses and also check "Display all websites in Compatibility View"

Close this box and open Internet Options at the bottom of the Tools menu

Open the Security tab (second tab) and click on Trusted sites and then on the Sites button

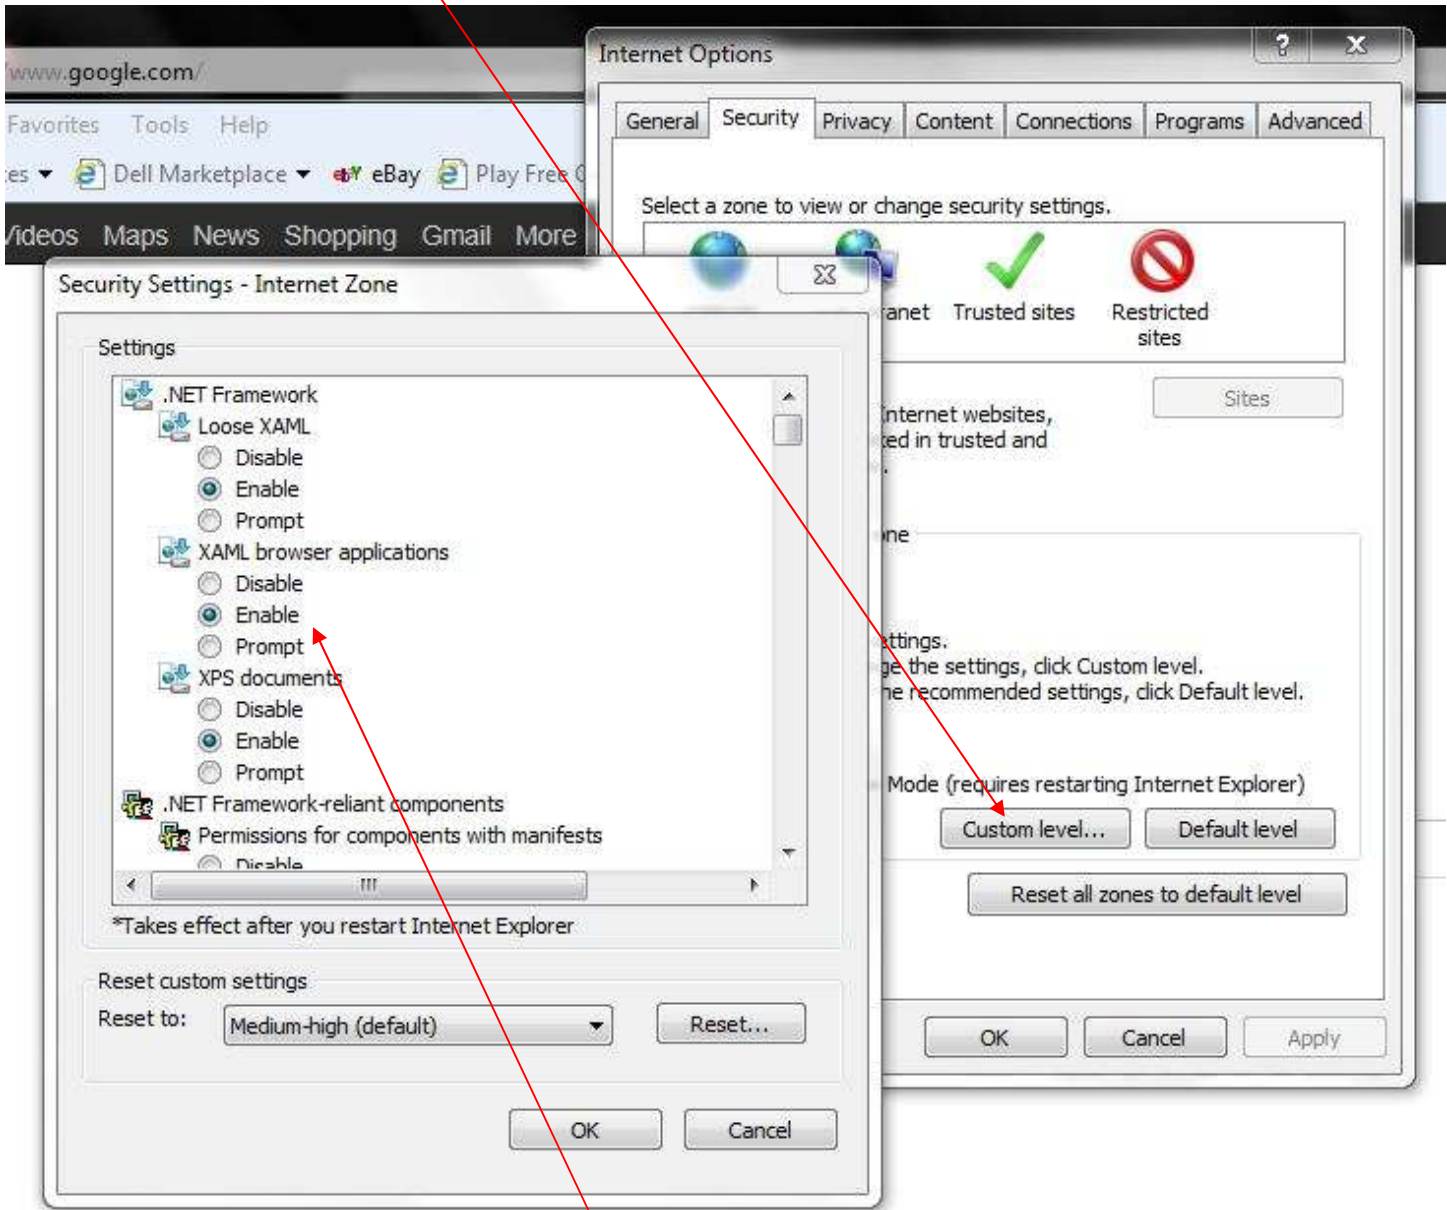

Add the addresses shown:

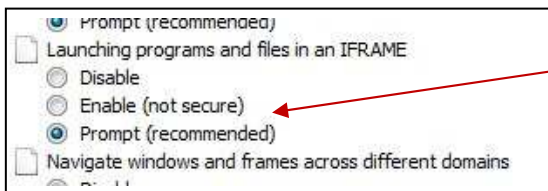

Make sure to uncheck here

Close the small window

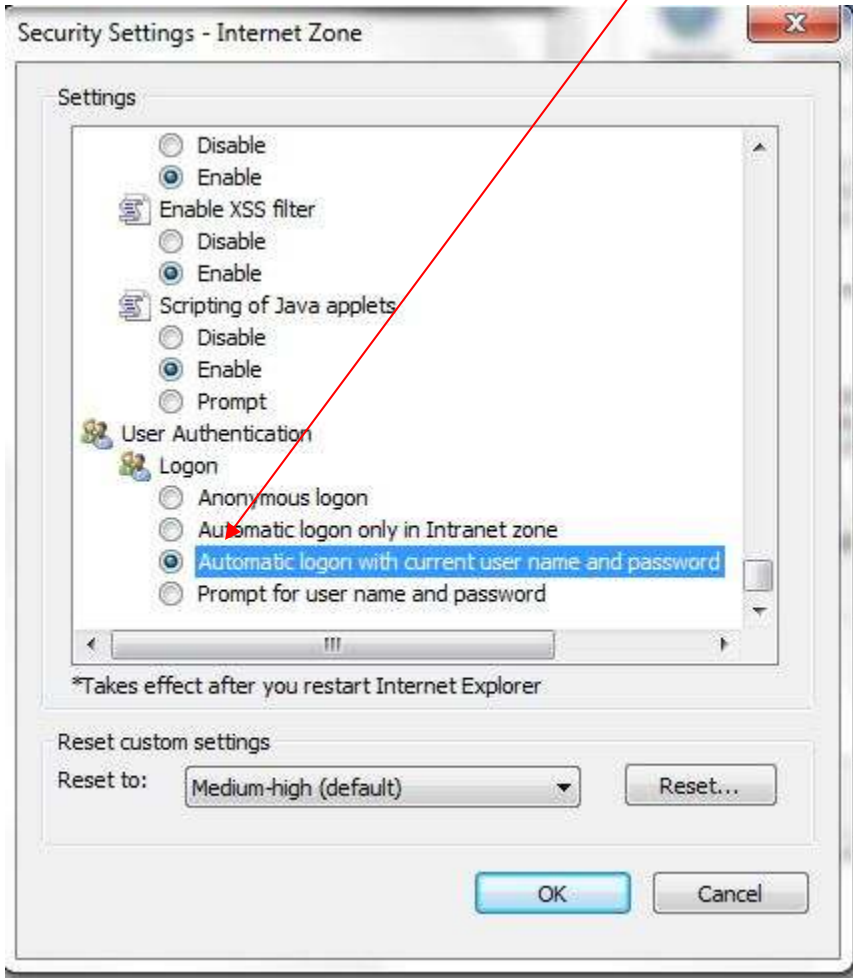

Click on the Custom Level button

Scroll through **all** the settings and set everything to "Enable" (or "Prompt" if it says it is "not secure")

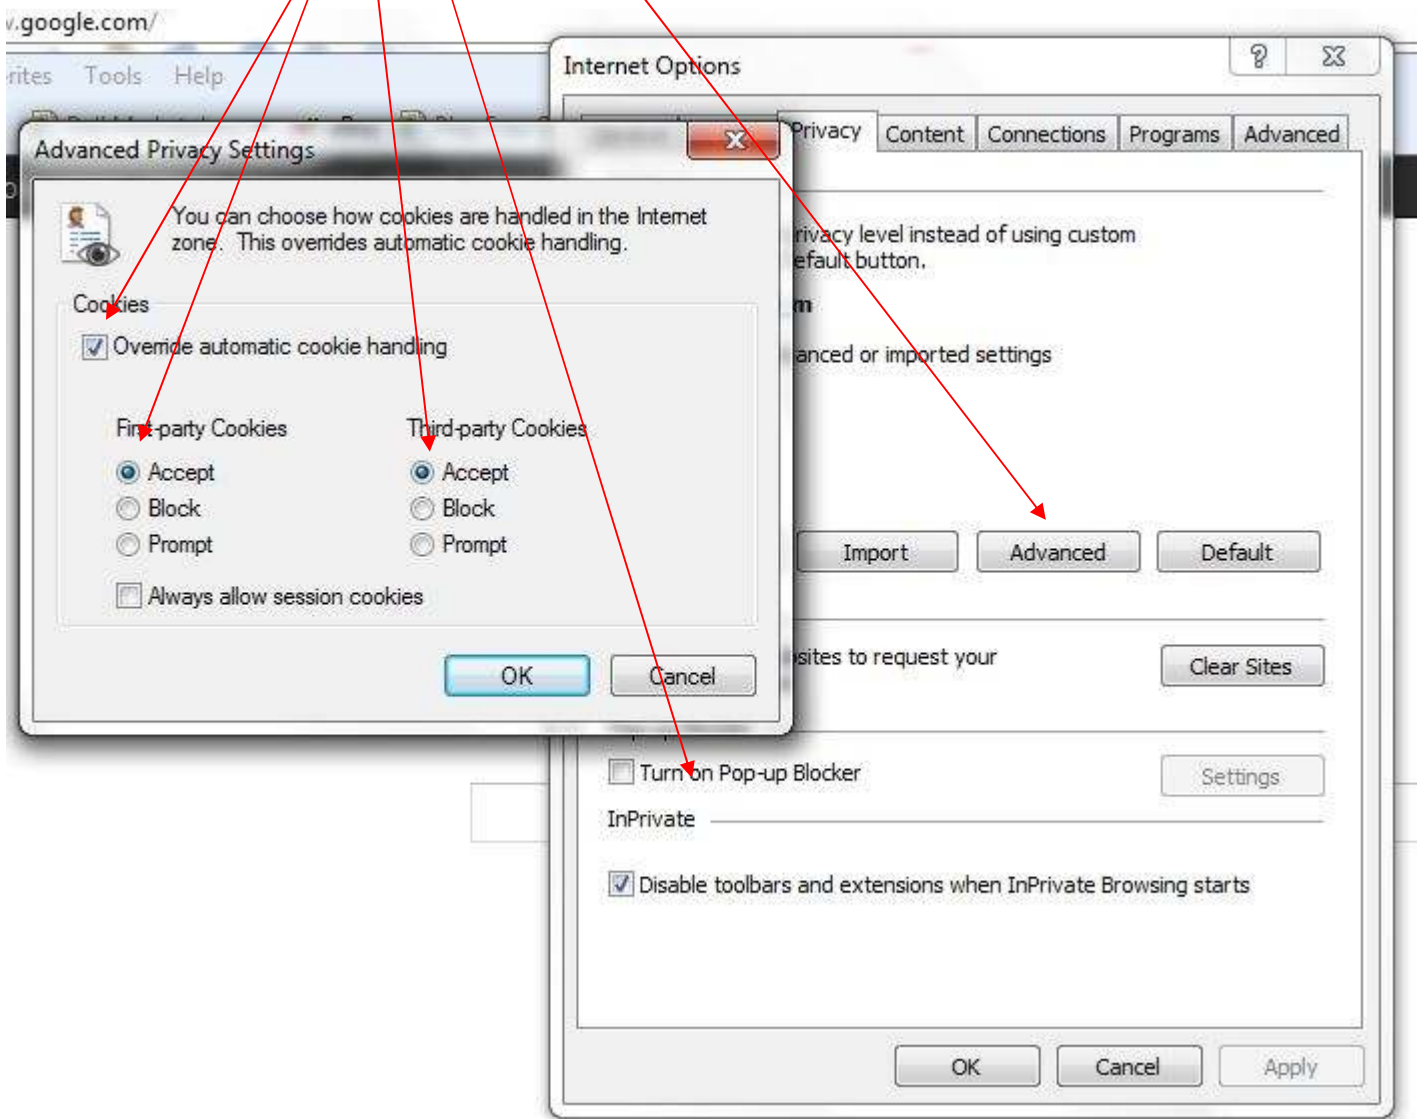

The very last section on this list should be set as follows:

Click OK -

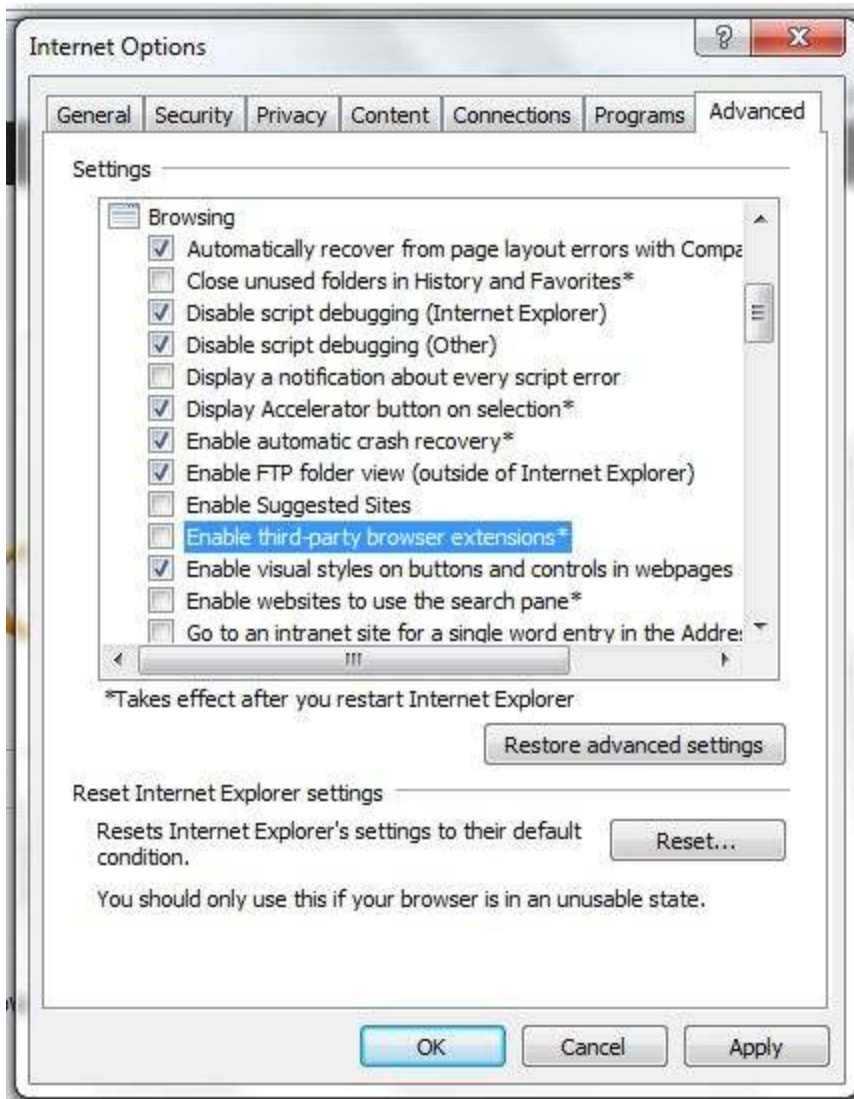

Move to the Privacy tab, click on the Advanced button and change settings as shown and again make sure your Pop-up Blocker is not checked:

Now let's move to the Advanced (last) tab

Uncheck all of the following:

- Enable third-party browser extensions*
- Reuse windows for launching shortcuts
- Check for server certificate revocation*
- Check for signatures on downloaded programs
- Enable SmartScreen Filter

Click "OK" and attempt your OCI Pacs login!

Or you may just want to "uninstall" IE9 and revert to IE8 which is supported by Philips
(have your network administrator help you)
